

BARCODE VERIFICATION

How to verify the legality of a barcode? By calculating the check digit, you can verify the authenticity of a barcode.

1. Add all numbers in even positions: $8+0+3+8+6+2=27$
2. Multiply the result of step one by 3: $27 \times 3 = 81$
3. Add all numbers in odd positions, without check digit: $4+3+1+5+9+4=26$
4. Add the result of step two to the result of step three to create sum: $81+26=107$
5. From the amount from the fourth step, discard the first digit.
6. Subtract the result of step five from 10: $10-7=3$

- If the check digit in the code matches the calculated one, this means that the code has been generated correctly.

Quite often the product may be labeled as "Made in Holland" while the code at the label is not matched with this country. There are a few reasons for this mismatch:

- the company is registered and obtained the code not in its own country but in the country of its major export destination;
- the product has been manufactured by the daughter company;
- the product has been manufactured in one country under license of the company of the other country;
- founders of the company have been companies from different countries.
